

Machine Learning Bootcamp

IDUG NA 2019: June 6, 2019

Mark Ryan
Jason Shayer
Steve Darling

What is Machine Learning?

Artificial Intelligence (AI)

Human intelligence exhibited by machines

- Reasoning
- Natural Language Processing (NLP)
- Planning

Machine Learning (ML)

An approach to achieve AI

- Gradient Boosting Machine (GBM)
- Support Vector Machine (SVM)
- Logistic Regression
- Factorization Machines (FM)
- Field-aware Factorization Machines (FFM)

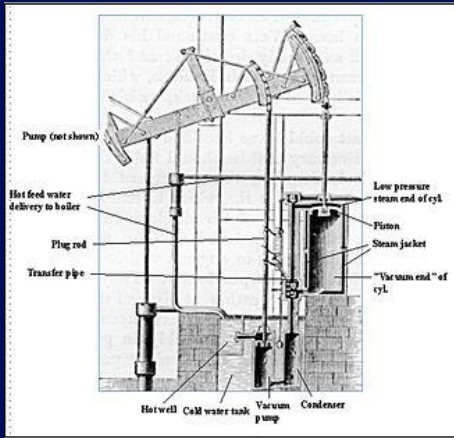

Deep Learning (DL)

A technique for implementing ML

- Deep Neural Networks
- Deep Belief Networks
- Recurrent Neural Networks

Where are we in the lifecycle of Machine Learning?

1770's:

- Watt's stationary engine
- Capital-intensive one-off applications

ML era: late 2000s

1829:

- Stephenson's Rocket
- Standardization and regular service

ML era: 2019

1941:

- Allegheny locomotive
- Apex of steam technology

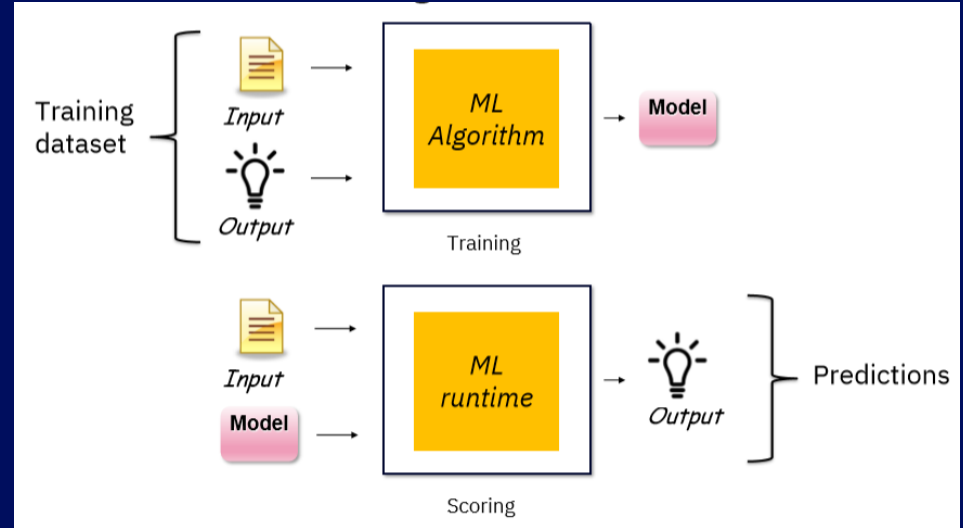

ML era: 5-10 years from now?

What is Machine Learning?

Classical Programming

Machine Learning

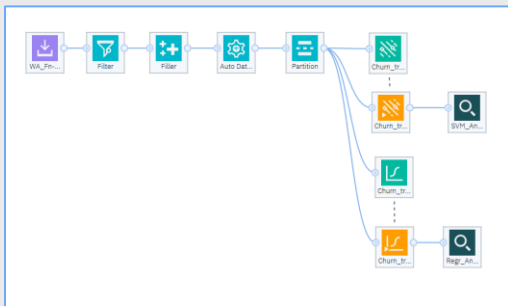

Customer churn: use case to illustrate machine learning

- **Customer churn:** when a customer ends their relationship with a business
- **PROBLEM:** You need to predict which of your customers are loyal and which are at risk of churning
- **SOLUTION:** Use data you have about clients to build a model that can predict whether a given client is going to churn

Customer Churn: the game plan

1

Solve the customer churn problem using Modeler

2

Solve the customer churn problem using Python

Python: Ingest Dataset

Click on the cell below to highlight it.

Then go to the **File** > **section** to the right of this notebook and click **Insert** > **code** for the data you have uploaded. Choose **Insert** > **code** > **DataFrame**.

```
url="https://raw.githubusercontent.com/ryasmaki187/sample2019_06_bootstrap/master/Wk_Fn-UseC_Telco-Customer-Churn.csv"
```

```
customer_data = pd.read_csv(url)
```

```
customer_data.head()
```

```
[5]:
```

	customerID	gender	SeniorCitizen	Partner	Dependents	tenure	PhoneService	MultipleLines	InternetService	OnlineSecurity	DeviceProtection	TechSupport	StreamingTV	StreamingMovies	Contract	PaperlessBilling	PaymentMethod	MonthlyCharges

9763-GRSKD	Male	0	Yes	Yes	13	Yes	No	DSL	Yes	No	No	No

Why?

Keep a subset of columns

Pick just the columns needed for the model

Deal with missing values

ML algorithms need numeric input

Deal with outliers

Control impact of anomalies

Scale continuous values

Consistent impact of columns

Deal with string values

ML algorithms need numeric input

Split Dataset into Train & Test

Need to reserve a portion of the data the model has never seen to validate the model

Deal with string values

Logistic Regression model

Pipeline:

- *Train the data preparation steps and the model in one operation*
- *Apply pipeline to get a churn / no churn prediction for a given client*
 - *Performs data prep on client's data*
 - *Applies model to get a prediction*

Machine learning models: Logistic Regression

- Classification: churn / no churn
- Extension of **linear regression**
 - simplest algorithm; used to predict continuous values
 - e.g. predict house price from # of bedrooms, sq. ft, frontage
- Logistic regression is “geared” to output between 0 and 1
 - treat 0.5 as the boundary

Machine learning models: Logistic Regression

- Define function: $\hat{Y} = h = \text{sigmoid}(X\theta)$
- \hat{Y} is the prediction (*predicted churn values*)
- X is the input
- θ is an array of weights

$$\text{Sigmoid}(z) = \frac{1}{1 + e^{-z}}$$

X

Y

Not quite!

MonthlyCharges	TotalCharges	InternetService	PaymentMethod	OnlineSecurity	Contract	tenure
29.85	29.85	DSL	Electronic check	No	Month-to-month	1
56.95	1889.50	DSL	Mailed check	Yes	One year	34
53.85	108.15	DSL	Mailed check	Yes	Month-to-month	2
42.30	1840.75	DSL	Bank transfer (automatic)	Yes	One year	45
70.70	151.65	Fiber optic	Electronic check	No	Month-to-month	2

Churn
No
No
Yes
No
Yes

Machine learning models: the secret sauce

- Define a **loss function** (delta between predictions $\hat{\mathbf{Y}}$ and actual values \mathbf{Y}):

$$h = g(X\theta)$$
$$J(\theta) = \frac{1}{m} \cdot (-y^T \log(h) - (1 - y)^T \log(1 - h))$$

- Repeatedly update θ (weights):
 - Calculate the *partial derivative* of the loss function with respect to the weights = $\mathbf{X}(\hat{\mathbf{Y}} - \mathbf{Y})$
 - Update the weights by subtracting the partial derivative
- What does making updates to the weights based on “the slope” of the loss function do?
- With these repeated updates to the weights, the loss function gets minimized and the accuracy of the model gets maximized**

Machine learning models: *all values must be numeric!*
